

Sahil Kumar

BCA PPU Batch 3

Roll no -4(A)

Basic Git Workflow

Step 1: Clone the repository

```
git clone https://github.com/extraordinary-user/addon_cimage.git
```

Step 2: Go inside the folder

```
cd addon_cimage
```

Step 3: Check file status

```
git status
```

Step 4: Check current branch

```
git branch
```

Step 5: Create and switch to a new branch

```
git checkout -b "feature-dev"
```

Step 6: Set your Git email

```
git config --global user.email "exampleuser2314@gmail.com"  
git config --global user.name "extraordinary-user"
```

Step 7: After adding or editing files, check status again

```
git status
```

Step 8: Add all changes

```
git add .
```

Step 9: Commit your changes

```
git commit -m "Added frontend and backend"
```

Step 10: Push your branch to GitHub

Steps to create EC2 Instance:

1. Go to AWS Management Console → EC2 → "Launch Instance".
2. Enter instance name.
3. Choose Amazon Machine Image (AMI), e.g., Amazon Linux 2 or Ubuntu.
4. Select instance type, e.g., t2.micro for free tier.
5. Create or choose an existing key pair (.pem file).
6. In Network settings, allow SSH (port 22) for Linux or RDP (port 3389) for Windows.
7. Configure storage (default 8 GB is fine).
8. Launch instance.
9. Once status is "running", note the public IPv4 address.
10. Connect via SSH:
or for Ubuntu:

```
ssh -i "your-key.pem" ubuntu@<public-ip>
```

For Running the Pipeline:

1. Launch EC2 instance its public IP.
2. In GitHub repo, go to **Settings** → **Secrets** → **Actions**. Add:
 - `EC2_HOST` = your EC2 public IP
 - `EC2_USER` = ubuntu or ec2-user
 - `EC2_KEY` = base64 of your `.pem` file
3. Add this file in your repo: `.github/workflows/main.yml`
4. Push to GitHub → it auto connects and runs on EC2.
5. To check weather its running or not connect AWS via SSH keys and run django project
6. Step 1 :

```
python --version
```

Step 2:

Create virtual environment

```
python -m venv venv
```

Step 3:

Activate venv:

```
env/Scripts/activate.bat
```

Step 4:

Install packages

```
python -m pip install -r requirements.txt
```

Step 5:

Run server

```
python manage.py runserver
```
