

Devops Workshop

Repository Tool:

Git:-

Steps:

- 1.Login to your GitHub Account.
- 2.click on new repository.
- 3.you will get the url of repo ,copy that.
- 4.create a new folder in the drive and right click and enter inside the git bash.
- 5.run the command:-
`git clone <repourl>`
- 6.u will see the folder added into ur folder in the repo name with your git file.
- 7.no copy your backend frontend code inside the repo folder.
- 8.run the following commands on the git bash:
`git status` // by default u will be inside the main branch
`git -b checkout "feature-dev"`
`git add .`
`gt commit -m "added".`
`git push --setupstream origin feature dev`

EC2 INSTANCE

STEPS:

- 1.Login to Your AWS count ,go to sign in to console.
- 2Search EC2 instance.
- 3.click on launch instance
- 4.write the name of the server
- 5.select the OS
- 6.SELECT AMI image free tier default
- 7.instance type
- 8.key pair:-existing r create new
- 9.launch instance
- 10.firewall security

CI-CD PIPELINE:

1.push your code on the git hub with yaml file.

2.add secrets to your codes:

EC_HOST:IPV4 address of your instance

EC_USER:UBUNTU

EC_SSH:copy the content of the pen file

3.keep ur pen file inside the folder and run the commands:

ssh -i nameofpenfile @ipv4 address

sudo apt update

apt list --upgradable

Sudo apt install python3-venv -y

4.now open your code in the vs code and write one comment and push it on github

5.now go in your repo:

You will see your comment with yellow dot

Click on details and deploy

6.your ci-cd pipeline is ready
